## Florida Leads Nation in Rejecting Covid Propaganda and Federal Diktats

Throughout the Covid-19 pandemic, Americans have been told time and again how to protect themselves from infection and disease. The simple formula that was channeled through all outlets of public communication was this: Wear a mask. Social-distance. Get vaccinated. Stay up-to-date with your vaccines. The Covid vaccines, of course, play a central role in all of this, and are currently recommended for all Americans starting at just six months old.

With the number of breakthrough infections demonstrating the shots' ineffectiveness, and with more and more adverse reactions recorded in the government's Vaccine Adverse Event Reporting System (VAERS), many everyday Americans wonder if the government will ever address the elephant in the room.

Luckily, the critical voices of officials occupying high-level healthcare positions are getting louder and clearer.

### Surgeon General Speaks Out

On October 7, Florida Surgeon General Joseph Ladapo recommended against men aged 18 to 39 receiving mRNA Covid shots because of the 84-percent increased relative risk of them having a heart attack within 28 days following inoculation. The analysis was drawn up from Florida's reportable disease repository "Merlin," the State Health Online Tracking System, and death records data.

Vaccine proponents, of course, claim that Covid infection itself poses a risk of cardiac complications greater than the risks associated with the shots. The Florida Department of Health (FDH) stresses that this is not the case, however: "With a high level of global immunity to COVID-19, the benefit of vaccination is likely outweighed by this abnormally high risk of cardiac-related death among men in this age group."

The department noted in the guidance that men over the age of 60 were 10-percent more likely to die of cardiac-related issues within 28 days of receiving mRNA vaccination.

The analysis of cardiac cases in vaccinated individuals done by the department found no association between non-mRNA shots and elevated risks of cardiac issues at any age.

Notably, the so-called viral vector vaccines against Covid, such as Johnson & Johnson, were previously linked to other cardiovascular complications such as blood clotting due to the fact that they, identically to their mRNA counterparts, instruct human cells to produce the most toxic part of SARS-CoV-2, the spike protein. According to the company's clinical trial results, male recipients over the age of 60 are at an increased risk of suffering cardiac arrests.

The Florida Health Department's guidance reaffirmed its earlier recommendation for parents and guardians to spare their little ones from Covid shots, adding that the youngest of Americans, who became "eligible" for mRNA inoculations from Pfizer and Moderna in June, should not be getting them either:

The Department continues to stand by its Guidance for Pediatric COVID-19 Vaccines issued

March 2022, which recommends against use in healthy children and adolescents 5 years old to 17 years old. This now includes recommendations against COVID-19 vaccination among infants and children under 5 years old, which has since been issued under Emergency Use Authorization.

“Studying the safety and efficacy of any medications, including vaccines, is an important component of public health,” said Dr. Ladapo in a statement accompanying the press release, adding, “Far less attention has been paid to safety and the concerns of many individuals have been dismissed — these are important findings that should be communicated to Floridians.”

Big Tech’s reaction was predictable. Twitter swiftly removed the updated guidance posted by the Florida surgeon general as violating its coronavirus “misinformation” policies. Specifically, Twitter stated that Dr. Ladapo’s tweet was “misleading,” per media reports.

## **Joseph Ladapo**

Following an uproar among Twitter users, the platform restored the post in two days, with no explanation.

While the methodology and limitations of the FDH analysis were harshly criticized, the surgeon general addressed such criticism in a subsequent thread, adding, “I love the discussion that we’ve stimulated. Isn’t it great when we discuss science transparently instead of trying to cancel one another?”

Various studies have shown Covid jabs are associated with the development and/or exacerbation of cardiovascular conditions, most often in young men. Last year, even the Centers for Disease Control and Prevention (CDC) and the Food and Drug Administration acknowledged, albeit ambiguously, an increased risk of developing conditions such as myocarditis and pericarditis after getting Pfizer’s or Moderna’s mRNA shots for adolescents and young adults.

With prominent physicians and scientists trying to warn the public about the devastating impact of Covid shots on the human body, Dr. Ladapo stands as the first figure in a public-health position to defy the federal recommendation and advise the younger demographic against getting mRNA Covid shots.

In an October 20 interview with *The New American*, the surgeon general explained the reasoning behind his advice. In a nutshell, at this point in the pandemic, children, who were not at risk of severe Covid outcomes, are now even more protected by their natural immunity. Citing a CDC survey, he noted that nearly 90 percent of children in America have contracted and recovered from Covid.

“It is very difficult to lower that risk more,” he noted. On the other hand, there is no long-term safety data on the experimental shots, and the emerging safety data is extremely troubling.

“It is really unwise to continue to push the product of which we continue to learn stuff about,” maintained Dr. Ladapo.

## **Stop Complying!**

The surgeon general expressed his hope that people would stop complying with the federally recommended policies, saying, “My hope for people is that they stand up and they stop allowing themselves to be pushed around by other individuals who don’t have their best interest in mind. All of this falls apart without our cooperation, without our contribution.... They’re such bad policies that they can’t stand on their own. They need your compliance to function, to have any reach or impact.”

This recommendation is now extremely relevant in light of the CDC’s Advisory Committee on Immunizations moving to add Covid shots to the childhood immunization schedule, which, as explained by Dr. Ladapo, paved the way for including them in locally mandated childhood vaccine schedules.

Fortunately, American parents, regardless of their own vaccination status, are not willing to get their little ones jabbed with experimental concoctions, according to official data. Remarkably, only five percent of children under the age of two, and eight percent of children aged two to four, have received at least one out of three doses of Covid shots since they became available in July. Roughly two-thirds of children aged five to 11, who became “eligible” for the shots in November 2021, remain unvaccinated. Hopefully, none of the parents of these children will cave to the pressure of the coming vaccine mandates for schoolchildren, and will either opt out or, better yet, take their kids out of the public schools altogether.
