Trump's 2018 Budget Won't Touch Social Security, Medicare

Treasury Secretary Steven Mnuchin [said on Fox News on Sunday](#) that cuts in entitlement programs — i.e., Social Security and Medicare — won't appear in the president's budget: "We are not touching those now. So don't expect to see that as part of this budget, OK? We are very focused on other aspects and that's what's very important to us."

Trump's budget for fiscal year 2018 (starting October 1, 2017) is expected to be presented to the House on Monday, March 13, just two weeks away. And there are a lot of moving parts that must be glued into place before then.

Those parts include Trump's plan to build a wall along the nation's southern border, expected to cost somewhere between \$15 and \$20 billion. Taxpayers will pay for that wall according to the president's executive order, with reimbursement to come from unknown sources at some unknown future date. There's the president's \$1 trillion plan to upgrade the nation's infrastructure (highways, bridges, tunnels, etc.). And he wants to increase the Pentagon's budget substantially to make the nation's military power "awesome." Finally, he wants to do this not by raising taxes, but by cutting them instead.

Mnuchin expressed just how this would work: "If we make business taxes more competitive, people will do more business here and we [the government] will get more revenues [even if tax rates are lower]. So, although there may be an absolute lower rate that doesn't necessarily mean [there will be] a corresponding drop in revenues."

Enter the Laffer Curve. Without using the term, Mnuchin expressed the belief system almost perfectly. Ascribed to Arthur Laffer in 1974, the Laffer Curve predicts that at some tax rate, likely lower than it is at present, government revenues will increase rather than decrease.

That prediction had better work in light of the budgetary wishes and constraints the Trump administration has already put in place. The United States' economy is the largest in the world, pumping out nearly 25 percent of the globe's \$74 trillion in goods and services and employing 152 million in the process. Surely, in there, somewhere, is enough revenue to pay for all of the Trump administration's plans without increasing the nation's debt.

Isn't there?

For fiscal year 2017, adopted under the Obama administration, healthcare takes up 22 percent of the government's nearly \$4 trillion budget, while Social Security and other pension and retirement programs soak up 19 percent. Federal education programs take up 15 percent, with military spending absorbing 12 percent. Welfare programs take another seven percent, while interest on the national debt

Written by [Bob Adelman](#) on February 27, 2017

hovers at six percent. That's 81 percent. The remaining 19 percent consists of transportation, operating the government, and "other" spending.

If Social Security and Medicare are taken off the table for cutting, the military budget is expanded, corporate and individual tax rates are reduced substantially, and interest rates stay the same for the foreseeable future, where else will the necessary cuts be levied to keep the annual deficit (\$587 billion in 2016) from growing?

Trump, Mnuchin, and the head of the White House Office and Management and Budget (OMB), Mick Mulvaney, had better hope that cuts in executive agency operations, reductions in regulations, eliminating ObamaCare and its drag on the economy, and Mr. Laffer's curve all perform as advertised.

Don't expect to read anything in Trump's budget about his faith in the Laffer Curve. Expect instead to read something about "dynamic scoring," the magic of modelling future results from those various changes in incentives, assuming they are passed by both the House and the Senate. Economists hedge their bets when talking about "dynamic scoring": Due to the complexity of modeling economic behaviors, applying dynamic scoring to a policy change "can be difficult." Forecasters "must infer" from current behavior just how those changes will impact the future.

In other words, President Trump and his economic advisors, when all is said and done and offered to the world as their solutions to solving the unsolvable, will be relying on science fiction writer Arthur Clarke's Third Law to explain it: "Any sufficiently advanced technology is indistinguishable from magic."
