

Worldwide Embalmer Blood Clot Surveys Show Possible Link to Covid Vaccines

After watching the *Died Suddenly* documentary the night it premiered in November of 2022, retired U.S. Air Force Major Thomas Haviland got an idea. A statement had been made at the 13-minute mark in the documentary by embalmer Wallace Hooker. Hooker stated that almost an entire room of 100 embalmers raised their hands when he asked if they were seeing new and unusual “white fibrous structures/clots” in the veins and arteries of corpses over the past year and a half.

Haviland, suspecting that no reporter would investigate, decided to contact the Ohio Embalmers Association (OEA), which had hosted the conference where Hooker, who was guest lecturing, had made the statement. Haviland spoke with the OEA president, second vice president, and secretary. While none of the three gentlemen happened to be in the room at the time that Hooker had asked for a show of hands, the OEA second vice president at that time, Woody Wilson, told Haviland that he himself had seen the “white fibrous clots” in his own embalming practice.

Now that Haviland had corroboration from an official at the Ohio Embalmers Association, he decided to do a survey to determine the extensiveness and prevalence of these new, large, tough, and rubbery “white fibrous clots.” Haviland conducted not one, but two “Worldwide Embalmer Blood Clot Surveys” at the end of 2022 and 2023, respectively, to determine what embalmers were seeing in embalming rooms, which are typically shrouded in mystery.

Haviland designed both surveys to be as “unbiased” as possible. At no point in either the survey instructions nor in the survey questions themselves did Haviland ever mention the words “Covid” or “Covid vaccines.” Haviland only asked the embalmers questions regarding “what” clots they saw, “when” they saw these clots, and “how often” they saw them (i.e., in what percentage of their corpses).

Haviland distributed both surveys using a “two-pronged approach.” He sent an email with a link to the survey to the presidents of 50 national, regional, and state Funeral Director Associations around the world, each with hundreds of funeral director and active embalmer members. Haviland also looked up the email addresses for more than 1,700 funeral homes around the world and sent them emails

directly.

The results of Haviland's first survey, covering through 2022, were shocking. Two-thirds of the embalmers responding to that survey (119 out of 179), and answered that they were indeed seeing the white fibrous clots. The main consensus of these embalmers was that they first started seeing these clots in 2021. And, most shockingly of all, the embalmers responded that they were seeing the white fibrous clots in an average of 30 percent of their corpses, with some embalmers saying that they were seeing the white fibrous clots in 50 percent or more of their corpses!

The results of Haviland's second survey, covering through 2023, were equally shocking. Seventy-three percent of the embalmers responding to the second survey (197 out of 269) answered that they were still seeing the white fibrous clots. The good news was that the percentage of corpses containing the white fibrous clots went down from 30 percent in 2022 to just 20 percent in 2023, but this might be an implication (not vindication) of the Covid-19 vaccines.

Recall that according to the CDC, about 80 percent of American adults took the "primary series" of the Covid vaccines back in 2021. However, per the CDC, only about 20 percent of American adults took the Omicron Bivalent Booster in Fall 2022, and only between 10 and 15 percent of Americans took the XBB 1.5 Booster in Fall 2023. So, if the Covid vaccines are the cause of the white fibrous clots, then one might expect the percentage of corpses containing these clots to start to go down as we got further away from when most people took their last injections in 2021.

In addition to the white fibrous clots still being a problem, Haviland also asked several questions on his second survey about another phenomenon called "micro-clotting." The embalmers describe this phenomenon as what looks like "coffee grounds" in the blood, or "dirty blood." In 2023, a staggering 79 percent of embalmers responding to the survey (212 out of 269) answered that they were seeing "micro-clotting" in an average of 25 percent of their corpses, with some embalmers seeing these "coffee grounds" in up to 50 percent or more of their corpses! Previous to the years of Covid, embalmers would only see micro-clotting in less than five percent of their corpses, usually in chemotherapy patients.

Haviland has submitted the results of both surveys to the FDA, CDC, and NIH.

Unfortunately, however, not once has Haviland been contacted by any of these organizations. Haviland asked to speak at the FDA's January 26, 2023 meeting of their Vaccine and Related Biological Products Advisory Committee (VRBPAC), but was denied. He did, however, submit a written package to the FDA on 19 January 2023, a full week prior to that meeting, and the FDA issued him a tracking number for his submission. So the FDA cannot now claim that they were not aware of this information.

Haviland believes that the results of his two surveys show a *strong correlation* between the Covid-19 vaccines and the onset and continued appearance of these new and unusual "white fibrous clots" that embalmers, many with 20 and 30 years of experience, had *never* seen until after the rollout of the Covid vaccines. Haviland strongly recommends that the entire Covid-19 vaccination program be stopped until the Covid vaccines can be ruled out as the cause.

Thomas Haviland spent 20 years in the U.S. Air Force, retiring at the rank of major. After that, he was a defense contractor working with the Air Force for an additional 16 years. Tom is an electrical engineer and data analyst who has worked with fighter aircraft such as the F-16 Fighting Falcon, the F-22 Raptor, and the F-117 Nighthawk stealth fighter. Tom's career came to an abrupt halt in October 2021 when he refused to take the Covid-19 vaccine. This took him on a journey that eventually led him to the creation of the two Worldwide Embalmer Blood Clot Surveys to investigate the appearance of new and

unusual “white fibrous clots” in corpses and their potential link to the Covid vaccines, as described by embalmers in the documentary Died Suddenly.
