New Study: Myocarditis Affects ONLY Covid “Vaccinated” Youths

An analysis of the first 15 months of the Covid pandemic in Germany, population 84 million, found that *zero* healthy children died of the disease. In this vein, epidemiologist Dr. Knut Wittkowski stated in March-May 2020 that children would be largely unaffected by Covid.

The response was censorship (e.g., YouTube [removed an interview Wittkowski gave](#) from its platform).

Another response was that Joe Biden administration authorities insisted that even children be given the largely untested Covid “vaccines.” This recommendation was eventually expanded to include *babies as young as six months old*.

And now another study, a massive one evaluating a million-plus kids, points to what a grave mistake this was. That is, it found that myocarditis and pericarditis (sometimes-fatal inflammatory heart conditions) affect *only* Covid “vaccinated” kids.

Reporting on the story recently, Blaze Media [writes](#):

The peer-reviewed study — conducted by researchers at the University of Oxford, the University of Bristol, and the Harvard T.H. Chan School of Public Health, and published in January in the scientific journal *Epidemiology* — looked at the safety and effectiveness of the Pfizer-BioNTech BNT162b2 COVID-19 vaccine in healthy children ages 5-15 following the rollout that began in late 2021.

Using data from the OpenSAFELY-TTP database with the blessing of NHS England, the researchers compared the “effectiveness and safety of: (1) the first vaccine dose versus no vaccination and (2) a second dose versus a single dose only.”

Specifically, they compared 141,711 children ages 5-11 and 410,463 adolescents ages 12-15 who were given a first dose of the vaccine with equal numbers of unvaccinated children from the same age groups.

... They noted ... that “myocarditis and pericarditis were documented only in the vaccinated groups, with rates of 27 and 10 cases/million after the first and second doses, respectively.”

Critics may say these rates are quite low. They would have a point, too, were Covid like influenza. That disease has, after all, claimed tens to hundreds of thousands of healthy children’s lives throughout the United States’ history. And vaccination decisions (and those involving medication generally) always involve cost/benefit analyses. But note here that the Centers for Disease Control’s [own data indicated](#)

that someone 0 to 19 years old who contracted the coronavirus had a 99.997 percent chance of survival. What's more, we learned in 2021 that the average Covid death age [was greater than the average lifespan](#).

So what can be said about giving even healthy kids briefly-tested shots to treat a disease that doesn't actually imperil them? It's grossly unethical.

Real Victims

When this story really hits home, however, is when it goes beyond the numbers and to the victims. Just consider Jacob Clynick, an apparently healthy 13-year-old boy from Michigan. He passed away in June 2021 of heart inflammation — [three days after his second Covid shot](#).

His heartbroken aunt, who was pro-"vaccine," subsequently wrote on Twitter, "I think parents should be warned of the risk."

Later in 2021, we learned about the case of 16-year-old Ernesto Ramirez, Jr. He died within [six days](#) of taking just one Pfizer Covid jab, shortly after the drug was authorized for teens. Ernesto had apparently also been healthy — and he also died of heart inflammation.

As did Clynick's aunt, Ernesto's grieving father put an onus on authorities, but somewhat more pointedly. "My government lied to me," he lamented.

There was in addition an unnamed seven-year-old Portuguese boy who passed away in 2024 after one Covid shot. An autopsy confirmed, [reported](#) PubMed, that he had developed pericarditis and myocarditis.

A few other unnamed victims were

- a 14-year-old Japanese girl [who died suddenly](#) of cardiopulmonary arrest two days after her third Covid jab; and
- two teen boys in Connecticut [who passed suddenly](#), shortly after their second Pfizer doses. Autopsies revealed "global myocardial injury."

Greater Magnitude Than We Know?

Yet this story gets even worse, points out commentator Eric Utter. As he [writes](#), referencing the new study:

Despite these findings, and many others like them, a coalition of medical organizations are [sic] fighting to legally *force* the government to keep recommending that even healthy kids and pregnant women take the COVID jabs. [Emphasis in original.]

What does this tell us about them?

The experimental mRNA non-vaccine vaccines left far too many kids with broken hearts. Literally. And broke the hearts of those who love them.

Exaggeration? Maybe — maybe not. Going beyond children, however, Utter notes that some of his family members took the jab. He states, too, that perhaps "one-third of them have experienced significant adverse effects. Guillain-Barré Syndrome, Myocarditis, tachycardia, etc."

This aligns with my own [anecdotal experiences](#), which were for me unprecedented and striking. I [wrote](#)

[in 2021](#) about a friend who developed heart inflammation after a Covid shot. He was taking medication to treat it. Around the same time, I met three men within a short period at the same recreational facility who all told me, unprompted, “I had a heart attack.” All had gotten Covid jabs not long before.

Then there was the neighbor who related that she developed a side effect involving her pelvis after a shot. Also roughly during this time, I [met a man](#) in a supermarket checkout line who was carrying two flower bouquets. One was for his brother, who’d died of a heart attack — *at age 24*.

The other was for a friend’s first-grade son who’d passed away — unexpectedly in his sleep.

The man was glassy-eyed and obviously grieving, making an inquiry about the departed’s “vaccine” status inappropriate. But would you want to bet they hadn’t gotten the shot?

There’s more that could be said, too, such as the nurse [who contacted me](#), explaining why she wouldn’t get jabbed. That is, she couldn’t believe all the new diagnoses she’d seen since the “vaccines” rollout.

So will we ever hear the verified truth about Covid-shot injuries’ true magnitude? I wouldn’t bet on it. The impetus for thorough investigation appears to have “died suddenly.”
