UN Wants Artificial Intelligence to Advance Agenda 2030

Imagine a world where supercomputers programmed by totalitarian technocrats make virtually every important decision for you, in addition to manipulating you at every turn. Such a dystopian future for the world may not be that far off — at least if humanity continues on its current course. And the technocrats behind the plan barely even bother to conceal their agenda at this point.

The United Nations is now *openly* [plotting with Big Business and Big Government to exploit Artificial Intelligence \(AI\) to further its agenda](#), especially the [totalitarian ideology it calls “sustainable development.”](#) Multiple UN bureaucracies have convened summits this year for that purpose, bringing together leading experts in the field from around the world. The goal: To harness AI and Big Data for what the UN considers to be “the global good.”

Now, the UN is even seeking to hire an “Artificial Intelligence Advisor” to help weaponize emerging technologies and AI to advance its totalitarian UN [“Agenda 2030” and the so-called “Sustainable Development Goals” \(SDGs\)](#) at the center of it. At the same time, the potential threat posed by AI is being cited as a pretext to further empower the UN to create global “laws” and regulations. And unsurprisingly, when the dangers of AI were mentioned, it was almost always in the context of empowering transnational institutions to “deal” with them by further empowering government and globalists.

A recent UN summit reiterated again that the world is quickly moving toward what experts refer to as “technocracy,” though that word is rarely used by its proponents or their useful idiots today. As the agenda becomes clearer, warnings are growing that freedom and self-government may not survive, at least if humanity does not restrain the forces seeking to use AI and technology to undermine them. But the battle is only just getting started.

A UN “Artificial Intelligence” confab last month, dubbed the [“AI for Good Global Summit,”](#) offered a great deal of insight into the twin dangers facing humanity from the dictators club and AI. Consider, for one, that the summit was hosted by the UN International Telecommunications Union (ITU). The controversial agency, which is at the [forefront of UN efforts to censor and tax the Internet](#), is [run by Chinese Communist Houlin Zhao, who in 2014 expressed publicly his belief that censorship was in the eye of the beholder](#). Other UN agencies run by [known communist agents](#) were listed as partners, too, and other Chinese Communist agents in the UN and beyond were deeply involved.

The agenda was bold. “AI innovation will also be central to the achievement of the United Nations’ Sustainable Development Goals (SDGs) and will help solving humanity’s grand challenges by capitalizing on the unprecedented quantities of data now being generated on sentiment behavior, human health, commerce, communications, migration and more,” said an official UN statement about the summit. “The Summit aimed to accelerate and advance the development and democratization of AI solutions that can address specific global challenges related to poverty, hunger, health, education, the environment, and others.”

Written by [Alex Newman](#) on July 27, 2017

Some 500 delegates attended the summit, according to the ITU. [Speakers included](#) policymakers, top UN bureaucrats, communist operatives, as well as employees of increasingly anti-liberty technology mega-companies such as Google, Facebook, Microsoft, and more. UN ITU Secretary-General Zhao, the Chinese Communist, explained that the event was aimed at helping determine “how the UN, ITU and other UN agencies can work together with industry and the academic community to promote AI innovation and create a good environment for the development of artificial intelligence.”

The summit, he said, would help produce a common understanding of how emerging technologies — and AI in particular — can be used to advance Agenda 2030. The [radical “masterplan for humanity” or “Declaration of Interdependence,” as UN leaders have called the UN plan](#), involves [national and international wealth redistribution, full-blown global governance, government control of production and resources, a surrender of liberty and national sovereignty, global indoctrination of children, and much more](#). Unsurprisingly, the [mass-murdering regime ruling Communist China boasted openly of its “crucial role” in developing the extreme UN Agenda](#).

“Today, we’ve gathered here to discuss how far AI can go, how much it will improve our lives, and how we can all work together to make it a force for good,” Zhao said. Anybody who believes an agent of the most murderous dictatorship in human history wants technology to be a “force for good” does not understand communism, or much of anything. Indeed, Zhao’s murderous masters in Beijing are pouring money into AI in a bid to more effectively maintain their brutal tyranny over the Chinese people. But as if to further substantiate the danger, the official ITU blog offered more insight into just how the UN hoped to exploit AI for its dangerous agenda in a piece headlined “[Accelerating the UN’s Sustainable Development Goals through AI](#).”

On “poverty,” for example, the ITU said AI would “provide real-time resource allocation through satellite mapping and data analysis of poverty.” So now, instead of central planners allocating resources, computers programmed by central planners will do so — almost certainly with similar results. AI and “Big Data analysis” can also be used for “targeted interventions” in the lives of children via “education,” which Agenda 2030 promises to use as a tool for indoctrinating children into becoming “critical agents of change” supporting the UN’s agenda. The schemes will also be used for “identifying and correcting for gender bias,” tracking fishermen and hunters, reducing “discrimination,” and more.

And that is just the start. “The AI of Everything, the digital AI mesh, fed by the ubiquitous IoT [Internet of Things], smart devices, and wearables, is already impacting smart cities and helping to create sustainable communities,” the UN ITU blog continued. “AI is yielding optimal consumption and production levels with vertical green farms, eliminating waste, and vastly improving yields and resource efficiency.” Again, if that sounds like technologically enhanced Marxism and central planning, good — because that is, essentially, what it is.

The secretary-general of the UN, [former Socialist International boss Antonio Guterres](#), also emphasized the significance of the UN’s scheming. “Artificial Intelligence is advancing dramatically. It is already transforming our world socially, economically, and politically,” he [noted in his welcome speech for the AI for Good Global Summit](#) in Geneva. “We face a new frontier, with advances moving at warp speed.” Among other applications, he said AI could help make predictions and even “prevent crimes.”

But there are also “serious challenges” and “ethical issues” at stake, he said, pointing to the dictators club he runs as the “universal platform for discussion” to help manage the transition to the brave new world. “Together, let us make sure we use Artificial Intelligence to enhance human dignity and serve the global good,” he added. Of course, as a longtime Socialist leader — [including a stint running a](#)

[global alliance of socialist and communist parties, many with the blood of countless innocents on their hands](#) — Guterres' vision of the "global good" is likely very different than the view of Christians, Americans, conservatives, free-market supporters, advocates of liberty, and countless others.

Another, smaller UN confab on AI was held earlier this year. As reported by UN supporter Peter Bendor-Samuel in early May, the UN Office for Project Services (UNOPS), which implements UN schemes, hosted a summit examining the security implications of AI. "The meeting was hosted by UNOPS with a view to consider how AI can be better deployed to support the UN mission," he wrote, noting that attendees included "leaders for companies such as Facebook, Google, IBM Watson, Intel and IPSofT, along with government entities and distinguished academics and journalists." In short, the summit appears to have been aimed at the eventual development of global "rules" on AI that would serve the UN agenda.

The UN is also seeking to hire experts to help it harness AI in order to advance the totalitarian UN Agenda 2030. According to a [recent job listing](#), the "Artificial Intelligence Advisor" will "utilize the latest techniques in artificial intelligence, machine learning (including e.g. deep learning and probabilistic inference), computer vision and natural language processing to develop projects harnessing Big Data in various forms (for example, telecoms data, satellite imagery and social media data) to support the monitoring and achievement of the Global Goals." The officials will also help tap into "Big Data for real world, large-scale problems related to monitoring and achievement of the Global Goals," among other duties. Perhaps most troubling, the expert will help the UN work on "predictive modeling."

But critics are sounding the alarm. [Patrick Wood, author of *Technocracy Rising: The Trojan Horse of Global Transformation*](#), warned of the tremendous dangers that such technology would pose in evil hands. "It has now been amply demonstrated that AI is as capable of deceiving, lying and committing criminal acts as any human," he told *The New American* in an e-mail. "This is intuitive to anyone who considers that AI is made by humans with all their preexisting biases. Why would anyone expect AI to behave differently than its creators? If anything, AI can only increase the speed of execution of those biases and result in more widespread underhanded acts."

Even establishment-minded experts and publications have warned that the emergence of Artificial Intelligence could threaten the viability of self-government if people are not careful. In a German article republished by *Scientific American*, for example, a collection of writers warned of a potential nightmare. "One thing is clear: the way in which we organize the economy and society will change fundamentally," they wrote. "If such widespread technologies are not compatible with our society's core values, sooner or later they will cause extensive damage. They could lead to an automated society with totalitarian features. In the worst case, a centralized artificial intelligence would control what we know, what we think and how we act."

When combined with other troubling developments and trends around the world — the [establishment push for a cashless society](#), the Communist Chinese regime's [Orwellian "Sesame Credit" scheme to rank all of its victims based on their slavishness](#), the emergence of ["smart cities,"](#) the [exploitation of Big Data by governments for tyranny](#), [constant warrantless surveillance](#), [extreme data-gathering and -mining deployed against children](#), and more — it is clear that humanity is at a dangerous crossroads. If the totalitarian-minded globalist establishment behind the UN wins, humanity will be condemned to a future of high-tech worldwide oppression that would make George Orwell and Aldous Huxley blush. But if humanity wins, the technology could certainly be used for good.

Written by [Alex Newman](#) on July 27, 2017

Freedom-loving, God-fearing Americans must get involved in the fight to preserve the Constitution and American independence — before it is too late. The alternative is a totalitarian global system of technocracy run by the UN and its globalist, Islamist, socialist, communist, and corrupt member regimes, with unfathomably dangerous technology at its disposal. And that should be considered unacceptable by all sensible people. The simplest way to prevent such an Orwellian nightmare is for the U.S. government to [withdraw from the UN using the American Sovereignty Restoration Act \(H.R. 193\)](#). All that is needed now is enough public pressure on Congress.
